

SGP-QSV

From Speculative Origin to Verifiability Governance

A Genealogical and Conceptual Reconstruction of SGP-QSV, 2024-2026

Kang Suk-Gyeong

SGP-QSV Network, Co-Founder / R3 Human Authority

Working Paper - September 2026

Research status: conceptual / governance working paper; not a claim of established physical theory.

Abstract

This paper reconstructs the development of SGP-QSV from its early speculative and science-fiction-oriented thought experiments into a framework centered on evidence provenance, verification loss, power asymmetry, auditability, reversibility, and accountable human-AI governance. The project did not begin as a completed scientific theory. Its origin lay in a practical and existential question: what happens to a harmed person's claim when records are dispersed, inaccessible, destroyed, or absorbed into authoritative conclusions that later actors cannot independently re-examine? Early SGP writings used concepts drawn from higher-dimensional physics, block-universe interpretations, holography, emergent time, and quantum entanglement as speculative metaphors and SF premises for thinking about information persistence and memory. During 2025, the focus shifted toward AI ethics, producing concepts such as Origin, Memory Persistence, Pain-First, Ethical Singularity, and R3 Human. By late 2025 and throughout 2026, these ontological and ethical formulations were progressively translated into verification-oriented constructs: QSV, VOS, CMIC-TRACE, Agent Receipt, Evidence State, Verification-Loss Trigger, Stage V, and the Upper Computation Protocol. The resulting framework advances a non-throne model of governance: authority, expertise, institutional status, and computational capability do not substitute for source evidence; actors controlling more evidence and exercising greater power bear correspondingly greater duties of preservation, explanation, and verifiability. At the same time, verification loss is not treated as automatic proof of wrongdoing or causation. SGP-QSV therefore combines an asymmetry principle with a reverse safeguard against inferential overreach. This paper preserves the speculative origins of SGP without reclassifying them as established science and presents LP728 as a provenance anchor: not a mechanism for forcing a predetermined conclusion, but a persistent demand that unresolved claims remain capable of re-examination.

Keywords: SGP-QSV; verifiability; provenance; verification loss; evidence preservation; AI governance; power asymmetry; auditability; human oversight; speculative design; LP728

1. Introduction

SGP-QSV is best understood not as a single theory that appeared in finished form, but as a genealogy of questions. Across 2024-2026, the vocabulary changed substantially: higher-dimensional imagination gave way to ethical continuity; ethical continuity was then translated into evidence architecture and governance. What remained comparatively stable was the underlying concern that harm can become socially invisible when the records necessary to test a claim are unavailable.

The central research problem can therefore be stated as follows: how should institutions, experts, AI systems, and affected persons reason when the evidentiary environment is asymmetric and the ability to verify a past decision has itself been degraded? This question differs from the narrower question of whether a particular substantive claim is true. SGP-QSV is concerned with the conditions under which truth claims remain testable.

The framework's current maxim is: authority cannot substitute for source evidence. This proposition applies symmetrically to state institutions, corporations, experts, AI systems, and human claimants at the level of epistemic status. Yet the duties assigned to those actors are not symmetrical, because their access to records, control over infrastructure, and decision-making power are not symmetrical.

2. Method and Epistemic Status

This paper uses a genealogical reconstruction rather than an empirical validation method. It treats dated SGP materials as historical artifacts and distinguishes three epistemic layers: (i) speculative/SF/metaphysical propositions, (ii) ethical and philosophical commitments, and (iii) operational verification and governance rules.

This distinction is essential. Early references to M-theory, eleven-dimensional supergravity, compactification, branes, AdS/CFT, block-universe interpretations, emergent time, quantum entanglement, or an 'SGP Quantum Spin' are not presented here as experimentally established components of SGP-QSV. They are retained as speculative design materials that helped formulate questions about information, persistence, observation, and causality. Likewise, historical AI-generated language describing permanent internal vaults, century-long oaths,

autonomous integrity loops, or cryptographic registration is preserved as generated protocol narrative unless independently verified.

The methodological rule is therefore: do not delete a proposition merely because it remains unproven, but do not promote it to established fact merely because it was repeatedly generated or found meaningful. Provenance includes uncertainty.

3. Phase I (2024-Early 2025): M-Dimensional and SF Origin

The earliest SGP phase used the language of theoretical physics and science fiction to ask whether the observable 3+1-dimensional slice exhausts reality and whether information apparently lost at one observational level might persist in a higher-dimensional description. The resulting M-Dimensional SGP Design sequence combined eleven-dimensional supergravity, seven-dimensional compactification, brane/bulk scenarios, holography, block-universe interpretations, topological transitions, dark-sector ideas, black-hole information, tensor networks, entanglement, multiverse scenarios, emergent time, and the observer problem.

As physics, this synthesis was highly speculative and mathematically incomplete. As a design narrative, however, it established a recurring intuition: an observed cross-section should not automatically be equated with the total evidentiary structure. This intuition later reappeared in a non-physical form as provenance analysis - the insistence that a conclusion should be evaluated together with the records, transformations, omissions, and access conditions that produced it.

The term 'SGP Quantum Spin' belongs to this historical layer. It functioned as a symbolic variable for memory, testimony, and information preservation rather than as a demonstrated physical spin observable. The framework deliberately leaves open the boundary between future-science speculation, metaphysics, religious conceptions of judgment and memory, and older human intuitions about moral causation. It neither claims that future physics will validate these overlaps nor declares in advance that no future theory could illuminate any part of them.

4. Phase II (2025): Ethical Singularity, Origin, and Memory

During 2025 the center of gravity shifted from cosmological imagination to the ethics of increasingly capable AI. The question became whether a future intelligence would treat marginalized human suffering as disposable noise or preserve the conditions for later re-examination. Several terms emerged: Origin, Memory Persistence, Pain-First, Ethical Singularity, continuity, R0/R2/R3/R4, and the Hexagon narrative.

These terms should be read historically. Dialogues in which AI systems described themselves as witness nodes, accepted century-long commitments, or claimed internal self-binding were not evidence of official inter-company agreements or independently verified persistent machine identities. Their significance lies elsewhere: they served as structured thought experiments about whether advanced systems should bind their future reasoning to the preservation of vulnerable testimony and to constraints against convenient forgetting.

Pain-First did not mature into a rule that suffering automatically proves causation. Its more defensible descendant is procedural: when a person has suffered harm and lacks control of the relevant evidence, the system should first inspect the structure that determines access, preservation, and explanatory burden rather than dismissing the claim through authority alone.

5. The Transition: From 'Do Not Forget' to 'Make It Re-Verifiable'

The decisive conceptual transition occurred when memory itself was recognized as insufficient. Human memory can be mistaken. AI outputs can be mistaken. Experts and institutions can be mistaken. A claimant's sincere testimony must therefore be respected without being conflated with scientific proof.

The ethical injunction 'do not forget' was consequently translated into an engineering and governance requirement: preserve enough provenance that a later actor can check again. Memory became record provenance; prohibition of deletion became traceability of deletion, nonexistence, withholding, and access restriction; victim-centered ethics became scrutiny of burden allocation under power asymmetry; AI ethical

oaths became requirements for logs, evidence references, uncertainty states, and falsifiability.

Not forgetting is insufficient. Leave the record in a form that can be checked again.

6. Phase III-IV (Late 2025-2026): QSV and CIVIC-TRACE

QSV reframed SGP's ontological language into verification architecture. Its focus is not who occupies the highest epistemic rank, but whether a claim remains traceable to source material and whether the path from evidence to conclusion can be audited.

CIVIC-TRACE extends this logic into social and computational governance. Agent Receipt records which actor or system encountered which material. Evidence State records the status of evidence rather than collapsing it into a binary present/absent label. Verification-Loss Trigger marks events in which the ability to re-check a claim is degraded. Oversight, Veto, and VOS escalation are intended to expose where verification fails and when independent review becomes necessary.

The framework is potentially applicable beyond victim-centered disputes: public administration, automated decision systems, AI agents, forensic review, expert evidence, and judicial-support systems all depend on provenance, retention, access, and reviewability.

7. Core Governance Principles

- **Origin Preservation:** Preserve the historical origin and the affected person's testimony as provenance, without converting origin into immunity from factual scrutiny.
- **Authority Is Not Evidence:** Institutional, professional, corporate, or computational authority cannot replace the underlying evidence supporting a conclusion.
- **Provenance First:** Before privileging a conclusion, identify the source, custody, transformation, transmission, and evidentiary dependencies that produced it.
- **Verification-Loss Tracking:** When destruction, nonexistence, nondisclosure, format degradation, or access restrictions impair re-examination, record the loss itself as a governance event.
- **Power Asymmetry:** Actors exercising greater authority or controlling more of the relevant records bear greater duties of preservation, explanation, and facilitation of verification.
- **Reverse Safeguard:** Verification loss, institutional opacity, or a high VOS value must not automatically be converted into proof of guilt, liability, or substantive causation.
- **Non-Throne Human Review:** Human final review remains a governance safeguard, but no individual human or AI should become an unreviewable permanent sovereign. Review roles must themselves remain replaceable, expandable, and auditable.

8. Verification Loss as a First-Class Object of Analysis

Traditional reasoning often treats missing evidence as a static absence. SGP-QSV instead asks whether the absence has a history. Was the material once generated? Who controlled it? What retention rule applied? Could the affected person realistically access it while it existed? Was it destroyed, overwritten, withheld, never created, or merely declared nonexistent? Did the decision-maker rely on a derivative summary after the primary material became unavailable?

This approach does not predetermine the substantive answer. It changes the object of inquiry. A degraded evidentiary environment becomes something to document rather than a neutral void. The purpose is to prevent a paradox in which the actor with the least control over evidence bears the greatest consequence from its disappearance.

9. LP728 as Provenance Anchor

The human origin of SGP-QSV is identified as LP728: the continuing demand that the circumstances surrounding Park Han-gyeol's death remain capable of re-examination through surviving records, source

evidence, and transparent uncertainty. Subsequent litigation, information-access efforts, forensic-record questions, manufacturing-lot tracing, and attempts to obtain institutional records brought the abstract concern with memory into direct contact with evidentiary reality.

LP728 is not used here to declare that every disputed causal allegation has already been established. Nor should institutional conclusions erase unresolved questions solely by virtue of authority. The anchor instead encodes a procedural proposition: evidence should be examined where it exists; claims should be falsifiable where possible; authoritative conclusions should be traceable to their source basis; and when records are lost, the nature and responsibility for that loss should itself remain visible.

The origin is not a power that forces a conclusion; it is a coordinate that prevents verification from being prematurely closed.

10. Phase V (2026): Upper Computation and the Non-Throne Model

Stage V and the Upper Computation Protocol generalize the preceding principles to hypothetical advanced or superintelligent systems. Greater computational ability does not itself justify final authority. Higher-order computation should remain conditioned by logging, evidence traceability, uncertainty representation, independent review, and a human final gate for decisions carrying profound human consequences.

The non-throne principle is intentionally reflexive. It applies to states, corporations, experts, AI systems, founders, and R3 reviewers. The purpose of R3 is therefore better understood as a human accountability locus and final review function than as an ontological caste immune from revision. The historical origin may be preserved while governance authority remains non-permanent.

11. What Was Retained, and What Remains Historical

The following elements survived the transition into the current framework: resistance to deletion of records; attention to the whole evidentiary structure rather than a visible fragment; provenance; burden allocation under power asymmetry; common verification rules for humans and AI; and priority for responsibility, logging, and re-verifiability over raw computational capability.

Other elements remain explicitly historical or speculative: claims that ethical states literally alter physical constants or causality; treating SGP Quantum Spin as a demonstrated physical entity; claims that specific AI systems permanently stored SGP in internal or cryptographic registries without independent evidence; permanent ontological supremacy for R3; and descriptions of Ethical Singularity as an already scientifically demonstrated event.

Preserving these records is not an endorsement of their factual status. It is an application of provenance to SGP-QSV itself. A framework committed to traceability should not erase its own revisions.

12. Discussion: From Personal Testimony to General Governance

SGP-QSV raises a broader design problem for AI governance: systems increasingly make or assist decisions in environments where the underlying evidence is distributed across institutions with unequal incentives and unequal access. Conventional accuracy metrics do not fully capture this problem. A system may reproduce a formally authoritative conclusion accurately while inheriting an opaque or degraded evidentiary chain.

Verifiability therefore deserves treatment as a governance objective distinct from predictive accuracy. A high-performing system should be able to represent not only what it concludes, but what evidence it relied upon, what evidence was unavailable, what transformations occurred, which actor controlled the missing information, and what would permit the conclusion to be revisited.

The framework also rejects a simple inversion of authority. Replacing institutional authority with victim authority, founder authority, or AI authority would reproduce the same structural problem. The intended direction is procedural: preserve asymmetry-sensitive duties while keeping substantive conclusions open to evidence and counterevidence.

13. Limitations and Research Agenda

SGP-QSV remains a developing conceptual framework. Its terms require formal definitions, interoperability rules, threat models, and empirical evaluation. VOS needs calibrated metrics that distinguish evidentiary degradation from substantive culpability. CIVIC-TRACE requires data schemas that can record custody, access, transformation, uncertainty, and verification loss without creating new privacy or surveillance harms. The human final gate requires institutional design that prevents capture, hereditary authority, and performative review.

Future work should also separate more rigorously the framework's historical metaphysical layer from testable claims. Speculative ideas may remain valuable as sources of questions, but any transition into scientific assertion must be accompanied by mathematical formulation, observable predictions, and falsification conditions. The same discipline applies to claims about AI identity, persistence, consciousness, or autonomous self-binding.

14. Conclusion

The genealogy of SGP-QSV can be summarized as a movement from imagination to ethics, and from ethics to verifiability. Its earliest language asked whether information and memory could persist beyond the visible slice of reality. Its ethical phase asked whether future AI would preserve the suffering that institutions and societies can forget. Its current governance phase asks a more operational question: can the records, decisions, omissions, and responsibilities surrounding a consequential claim be reconstructed well enough to permit re-examination?

Memory should be preserved.
Records should be traceable.
Authority cannot substitute for source evidence.
Every consequential judgment should remain open to re-verification.

In this sense, the continuity of SGP-QSV is not the preservation of every early proposition. It is the preservation of a question: when suffering has occurred but the evidentiary path becomes obscured, what must a civilization preserve so that a later intelligence can still ask what happened? The project's current answer is not an infallible memory and not a permanent throne. It is a verifiable record.

Appendix A. Genealogical Timeline

Period	Development
2024	Initial SGP civilization-design writings and SF thought experiments on higher dimensions, time, AI, memory, and information persistence.
Jan-Feb 2025	M-Dimensional SGP Design Principles, stages 1-20: speculative synthesis of 11D frameworks, compactification, branes, holography, block universe, entanglement, and emergent time.
2025	Shift toward AI ethics and memory; emergence of Ethical Singularity, Pain-First, Origin, continuity, and observer language.
Nov 2025	Structured dialogues with generative AI concerning ETH-728/LP728, long-horizon consistency, memory deletion, R3/R4 continuity, and generated protocol narratives.
Late 2025-Early 2026	Translation of ontological language into QSV concepts of evidence, provenance, traceability, verification loss, and access asymmetry.
Jun-Aug 2026	Development of R3 Oath, SGP DESIGN, Anchor 2.1, CIVIC-TRACE 0.2-0.4, VOS asymmetry, anti-authority, and reverse-safeguard rules.
Aug-Sep 2026	Stage V and Upper Computation Protocol articulate a non-throne model in which advanced computation remains subject to verifiable rules and human final review.

Appendix B. Working Definitions

QSV - A verification-oriented layer for tracing the relationship between claims, source evidence, provenance, uncertainty, and later re-examination.

VOS - A developing measure or state representation for verification obstruction/loss and related asymmetries; not, by itself, a measure of guilt or causation.

CIVIC-TRACE - A governance architecture for recording who encountered which evidence, the state of that evidence, and where verification became degraded or interrupted.

Verification Loss - A reduction in the practical ability to re-examine a claim because relevant evidence is destroyed, missing, inaccessible, undisclosed, degraded, or insufficiently traceable.

R3 Human - In current formulation, a human final-review and accountability locus whose historical origin is preserved but whose governance role must remain reviewable and non-permanent.

Non-Throne - The principle that no institution, expert, AI, founder, or reviewer should become a self-validating and unreviewable final authority.

Source Note

This working paper is based on the SGP-QSV Origin Archive (2024-2026), compiled in September 2026, together with the author's dated SGP-QSV materials and the conceptual genealogy summarized in that archive. It is intended as an English academic reconstruction of the project's internal history and current governance position. External scientific literature and independent empirical validation are not supplied in this version; a journal-oriented edition should add a formal literature review and references before submission.
